1. INTRODUCTION TO THE CHECKLIST FOR UPSCALING BEST PRACTICES

There are several policy and measure best practices across the EU for combatting energy poverty in the Private Rented Sector (PRS). These range from the financing of building renovations to Energy Efficiency Obligation Schemes and information and advise measures for landlords and tenants. These best practices originate from ten successfully delivered policies, which have been adapted during the Horizon 2020 ENPOR project to address energy poverty in the PRS market. The checklist items are intended to be *interdependent yet flexible*. Some steps, such as developing inclusive eligibility criteria and establishing support centers, lay the groundwork for others, like monitoring renovations and involving tenants in decision-making. While the actions can be initiated in parallel, certain foundational steps, particularly those involving policy framework development and stakeholder engagement, are best addressed early in the process of upscaling best practices to ensure a solid foundation for subsequent actions.

2. UPSCALING INFORMATION AND TRAINING PROGRAMS

This checklist tool is designed for policymakers at various governance levels - from the EU down to national and regional authorities - as well as for the multitude of stakeholders directly involved in the implementation of energy poverty alleviation policies. The spectrum of these stakeholders is broad, ranging from utility service providers, social sector professionals, and representatives advocating for the rights and interests of tenants and landlords within the PRS. This checklist is structured to guarantee that these initiatives are not only inclusive and specific to the identified target group but that they also maintain longevity and adaptability over time, with a focus on application and iterative improvements.

The direct impact of such a checklist is on energy-poor households within the PRS, who will be benefitting from a thorough repository of knowledge and tools that enable them to manage their energy consumption and related expenses with more autonomy, awareness and efficiency. Indirectly, the checklist is set to facilitate a heightened degree of clarity and improved collaborative efforts among stakeholders, laying the groundwork for a more integrated approach to tackle energy poverty.

2.1 Collaborative Outreach and Material Dissemination

Provide d	lecentralise	ed consultin	g ser	vices to sup	port existing	institutio	ns (whetl	her
			-	•	ources provi		•	
processes	. This can h	appen throu	ıgh:					
	Conductin	ng region-sp	ecific	needs asses	sments, both	through	surveys a	nd
	data analys	sis, in consu	ltatio	n with local a	gencies.			
	Mapping	resources	and	identifying	institutions	offering	support	or
	collaborati	on, such as	gover	nmental and	d energy ager	ncies, as v	vell as NG	Os,

RECOMMENDATIONS FOR REPLICATING BEST PRACTICES FOR ENERGY POVERTY IN THE PRIVATE RENTED SECTOR

	but also utility co	ompanies and	research in	stitutions and univers	ity, to not
	forget community	groups and a	ssociations.		
	Based on availabl	e resources, p	lan and imp	lement a viable financ	ial model,
	that eventually in	corporates bot	h private an	d governmental fundin	g, thereby
	making this effort	more sustaina	able and like	ely to succeed in the lor	ng run.
	Define implemen	tation strateg	ies for the	material dissemination	n, through
	target distribution	n channels (also	o using local	media, when possible)	, engaging
	in community col	laboration and	leveraging	existing networks.	
	Make use of ider	ntified instituti	ons to esta	blish local partnership	and in so
	doing, increase tr	ust in engaged	communiti	es.	
☐ Collabora	ate with local an	d regional ag	encies to o	distribute multilingual	materials
according to	the local needs	with easy-to-u	nderstand a	advice and pictures or	n reducing
energy pover	ty, thereby promo	oting wider acc	essibility an	d understanding acros	s different
communities	. The same materi	als can also be	distributed	to other countries besi	de the one
producing it,	due to the initial e	efforts to make	materials a	vailable in several lang	uages.
□ Take adva	antage of tailored	l communicati	on materia	ls and channels, by us	sing flyers,
posters, ema	ils, and other ma	iterials, such a	s the energ	gy boxes, to provide le	egible and
replicable inf	ormation and ene	rgy saving prac	tices. To en	gage broader audience:	s, organise
community 6	events, such as w	orkshops and	seminars, a	and open forums and	discussion
panels, and	make use of soci	al networks, v	hile ensuri	ng communication cha	annels are
adapted	to	the	relevant	target	groups.

Real world examples

Examples of best practices include Austria's approach to reducing language barriers in energy poverty materials and the successful dissemination strategies targeting energy poor tenants and households. Outside of the measures implemented in ENPOR, a second example from the MCPE Project includes conducting home visits for personalized energy-saving advice, with a dual-visit approach: initial visits for basic energy-saving tips and follow-up visits by energy experts to assist with bill understanding and renovation scheme eligibility. This approach ensures a deepened understanding of individual household needs and effective dissemination of practical energy conservation knowledge.

2.2 Comprehensive Understanding of Energy Conservation

\square Through Social Energy Advice , offer low-threshold energy advice via trained social
advisors, focusing on reducing energy consumption without significant investments.
☐ Organise training sessions at the local or regional level with a focus on understanding
energy bills and conservation methods, tailored to the specific needs of each community.
The results of these training sessions can be used for outlining a strategy to deliver
community-specific training sessions focused on energy literacy and saving, with the aim

RECOMMENDATIONS FOR REPLICATING BEST PRACTICES FOR ENERGY POVERTY IN THE PRIVATE RENTED SECTOR

of using the insights gained from these sessions to improve and expand the program's reach and impact.
reach and impact.
$\hfill\square$ Develop materials based on EU recommendations on energy poverty that can be
customised for national use, ensuring consistency in the information provided across
member states.

Real world examples

In Germany, follow-up surveys as part of the StromSparCheck measure showed improved understanding of energy conservation among tenants as it was assessed throughout the ENPOR project, as this approach included engaging unemployed individuals as social advisors, providing both employment opportunities and enhancing the social impact of energy poverty programs. Additionally, within Italy's educational training policy, more comprehensive communication strategies have led to an increase in knowledge on energy conservation measures as reported by past survey results for the overall campaign.

Similarly, POWERPOOR, ENPOR's sister project, has educated 1174 Energy Supporter and Mentor on EU level through their "Training seminars for Energy Supporters and Mentors". Additionally, they engage directly with energy poor citizens and advise them on improving their energy efficiency. Energy Mentors provide support and expertise related to energy communities and crowdfunding at a local or regional level and staff the Energy Poverty Alleviation Offices (EPAO) that have been established in municipalities.

2.3 Monitoring and Evaluation for Long-term Effectiveness

☐ Although likely re	esource intensive, a f	ocus on continuo :	us monitoring	is impera	tive. Put
in place a monitor	ing system with suit	table indicators, i	in collaborati	on with s	tatistical
institutes and the	use of tools like the	Energy Poverty	Dashboard (E	PD) but a	ilso take
advantage of utilizir	ng qualitative data (pe	eople's lived exper	iences & need	ds) to integ	grate the
monitoring and inform better policies.					
\square Set EU standards for monitoring and evaluation that can be adapted and implemented					
at national and regi	onal levels to ensure	consistency in lon	g-term impac	t assessme	ents. For
this purpose, use	regional data to as	sess energy bill	savings and	conduct I	localised
evaluations	of	policy		effect	tiveness.

Examples of best practices include the need for ongoing monitoring as highlighted in the Austrian and German policies to assess the long-term effectiveness of energy advice.

Additionally, in 2020, as part of the Compete4SECAP project, three Croatian cities include energy poverty as their measures. Two non-ENPOR key measures available in the <u>municipal SECAP in the City of Rijeka</u> aimed at reducing energy poverty for socially vulnerable groups while enhancing efficiency and aiming at long-term energy poverty alleviation: one is cofinancing energy renovations of families unable to invest independently (which was also done in Zadar), with the other being the establishment of a center for energy counselling, as also present in the <u>city of Osijek</u>. Furthermore, in Osijek, a small energy efficiency measure, namely energy boxes, was implemented. This measure of Energy boxes is similar to the ENPOR policy in the Netherlands. After these three cities introduced measures for energy poverty, another 12 cities and municipalities in Croatia designed measures for energy poverty.

Under EPAH TA, the city of Zagreb has designed the "Program to reduce energy poverty in the area of the city of Zagreb for the period until 2030". The Program includes seven measures: the Establishment of a system for collecting and monitoring data on energy poverty; Energy consulting, Energy box, Replacement of household appliances, Energy renovation of multiapartment buildings and Energy renovation of family houses.

2.4 Stakeholder Engagement and Capacity Building

☐ Offer capillary and collaborative trainings sessions for social workers and energy advisors, involving representatives from target groups both in the training design as well
as in the delivery process. Throughout ENPOR, the co-creation process increased the
holistic understanding of various actors' needs, allowing for the resulting measures to be
tailored and therefore more relevant to those targeted.
$\hfill\square$ Implement training and information programs designed for regional adaptation and
execution at the national level by fostering new collaborations, improving skills, and
facilitating cooperation between state organizations and stakeholders.
$\hfill\square$ For replication of national programs within a Member State that wishes to implement
training and information measures, forums and working groups should be created to
promote, exchange and collaborate on energy poverty, ensuring the participation of
diverse stakeholders including property owners and tenants.

An example of best practices from the <u>REACH programme</u>, implemented by the Energy Agency of Plovdiv and covering Croatia, North Macedonia, Bulgaria, and Slovenia, include empowering energy-poor households to save energy and change habits. The programme focused on establishing energy poverty as a critical issue requiring tailor-made policies in these countries with key components involved such as engaging decision-makers and providing them with actionable recommendations, thereby fostering a more informed and responsive approach to energy poverty at both the local and national levels.

In Croatia, under the REACH project, the Energy box was used during simple energy audit in Sisak Moslavina County for the first time.

2.5 Data-Driven Policy Development

- ☐ Push for the collection of data on energy poverty and the effectiveness of implemented measures continuously to support long-term evaluation by providing support to institutions via training or direct collaborations.
- ☐ Use EU frameworks to guide the collection of new insights and data to inform the implementation of energy poverty policies. At the national level, integrate these insights into the design of future energy poverty policies and programs, ensuring alignment with broader strategies. Relevant EU frameworks to keep into consideration are:
 - Commission Staff Working Document (SWD/2003/647): EU guidance on energy poverty (accompanying the Commission Recommendation on energy poverty (C/2023/4080)
 - Commission Staff Working Document (SWD/2003/647): EU guidance on energy poverty (accompanying the Commission Recommendation on energy poverty (C/2023/4080)Commission Recommendation (EU) 2023/2407 of 20 October 2023 on energy poverty
 - Commission Recommendation (EU) 2023/2407 of 20 October 2023 on energy poverty
 - Directive (EU) 2018/844 of the European Parliament and of the Council of 30
 May 2018 amending Directive 2010/31/EU on the energy performance of buildings and Directive 2012/27/EU on energy efficiency (Text with EEA relevance)
 - o <u>Energy Poverty Advisory Hub</u> offers more tools and information.

The Lithuanian Ministry of Energy includes a <u>legal</u> requirement for energy suppliers to provide advice and education to consumers on energy saving measures, ensuring consumers receive valuable information on how to enhance energy efficiency and change consumption behaviors, with a mandate for suppliers to disseminate this information at least annually. This approach not only increases consumer awareness but also holds suppliers accountable for participating in national energy efficiency efforts.

2.6 Enhancing Resource Availability

☐ Combine energy-saving measures with coaching, installation services, and repeat visits
to ensure the highest effectiveness of outreach activities.
☐ Verify available resources at the national or regional levels to establish funding streams
dedicated to energy efficiency renovations. If feasible, develop these funding streams to
complement informational and training measures.
\square Ensure these funding streams are designed to be accessible and transparent in their
application process while also including specific provisions in the funding streams, such as
earmarking amounts for households under a specific income threshold.
☐ Locally, improve access to financial and informational resources to enable stakeholders
to undertake energy conservation measures and renovations. See Establish Point 2 One-
Stop-Shop Support Centers below.

Real world examples

Examples of best practices include Italy's efforts in promoting the production of new data on energy poverty in the PRS and seeking opportunities for funding allocation.

In Croatia, connecting surveys from EmpowerMed project in the city of Zadar, the POWERPOOR project in the city of Križevci and EPAH TA in the city of Zagreb with ENPOR project by including questions about property ownership to gather data on the tenant's situation regarding energy consumption and the energy performance of buildings.

3. UPSCALING FUNDING SCHEMES FOR ENERGY POVERTY

This second implementation checklist is targeted at governmental entities, energy agencies, housing collectives, and non-governmental organisations actively involved both locally and nationally in addressing energy poverty through renovation grants and financing schemes. The core aim is to refine, fortify, replicate and upscale the methodologies associated with the allocation and utilisation of renovation grants. To do so, this checklist ensures that fiscal mechanisms developed are not only expansive and encompassing but are also finely tuned to confront the complex landscape of energy poverty in the PRS.

The completion of this checklist foresees significant advancements in the quality of life for tenants within the PRS, allowing for the delivery of better living conditions, the redistribution and related diminishing of financial burden related to energy expenses, and the fortification of energy security. Property owners and housing associations will also benefit from schemes developed using this list, thereby gaining access to information with clear instructions, robust financial support, and an increase in property value post-renovation.

3.1 **Develop More Inclusive Eligibility and Support Structures/Schemes** Design renovation grants with **inclusive eligibility** criteria that consider social, economic, and energy-related factors, including tenure status. ☐ Structure the grants so that approved applicants receive up to 100% of the renovation funds upfront, based on strict income criteria. Applicants should then be obligated to provide proof of completed renovations within a specified timeline, moving away from reimbursement-based models. ☐ Drastically improve rent control regulations alongside increased funding for rented buildings to prevent renovictions.1 ☐ Identify the split incentive issue in regional and national housing and renovation regulations as well as funding schemes. Tools and methodologies to calculate the energy renovation costs covered by landlords and tenants should be used, which are informed by the benefits each party gains from renovations. To determine appropriate measures to mitigate the split incentive problem, tools like the split incentive calculator can be used to determine the proportion of renovation costs to be borne by landlords and tenants, based on the benefits each party receives, thereby informing energy-related policy making and ☐ Develop an all-inclusive energy poverty regulatory and policy framework that connects individual energy efficiency measures to the national policy landscape, as is expected in the 2024 NECP updates.

¹ This recommendation has been produced by the ENPOR project and does not necessarily reflect the views of LIIPI.

Examples of best practices include Estonia's refined targeting of renovation grants towards buildings likely inhabited by low-income households. The Greek measures – <u>Savings at Home I and II</u> - can also be considered best practices in terms of granting subsidies directly, rather than applying for reimbursements later, although only a select few target groups are allowed a 100% support, and for now partial investments are still considered loans to be paid back.

3.2 Establish One-Stop-Shop Support Centers

\square Create (and ensure continuous public funding for) one-stop-shops (OSS) or dedicated
public offices at the national and regional level, offering comprehensive guidance and
support to landlords and tenants in a cooperative manner.
\square In these same OSS locations, provide $oldsymbol{ongoing}$ $oldsymbol{technical}$ and $oldsymbol{administrative}$ $oldsymbol{support}$ and
simplified processes for renovation grants at the regional and local levels, ensuring
accessibility for all aforementioned stakeholders

Real world examples

Examples of best practices can be drawn from the concept of one-stop shops as seen in other EU initiatives, where comprehensive guidance and support are provided to stakeholders, streamlining the process of accessing and utilising renovation grants. Some other best practices include:

- Hauts-de-France Pass Renovation in France, the technical and financial instrument designed by the regional Public Service for Energy Efficiency
- SuperHomes in the UK: creating more and more energy-aware households that are redefining green living.
- <u>CoachCopro</u> in France: public service for the renovation of co-properties
- o <u>Setting up community energy one-stop-shops –</u> <u>Guidance document</u>
- LIFE crOss renoHome in Croatia: city of Zagreb and city of Križevci

3.3 Prioritise whole-Building Renovation Approach	3.3	Prioritise Whole-Building Renovation Approaches
---	-----	--

☐ Advocate for regulations and legislation that focus on the renovation of entire buildings
to maximise energy efficiency improvements on a larger scale.
☐ Work towards policies that equitably redistribute the financial responsibilities of energy
renovations, ensuring that costs are shared fairly among stakeholders.
☐ Encourage the full renovation of historical buildings, focusing on preserving heritage
while simultaneously enhancing their energy efficiency.
☐ Support clustered renovations and district-wide improvements, simplifying joint
procurement and improving the capacity of building associations.

Examples of best practices from the <u>Programme for Renovation in Areas of Special State Concern</u>, initiated by the Croatian Government, include the comprehensive approach to restoring national buildings in priority areas. The program aims to significantly reduce energy poverty and improve tenant health, while also boosting employment and the use of renewable energy sources. Notably, the program has so far covered the renovation of 387 residential buildings, with plans to finance 100% of the renovation costs, demonstrating a strong commitment to addressing both energy efficiency and economic development in these targeted areas.

3.4 Implement Effective Measurement and Monitoring

☐ Develop robust systems to measure and monitor the impacts of policies on energy poverty, using suitable indicators at the EU and national levels. To do so:
☐ Identify specific indicators that accurately reflect the dimensions of energy poverty in your region.
☐ Align national data collection and monitoring systems with EU frameworks, such as the Energy Poverty Advisory Hub or similar platforms.
☐ Engage with stakeholders including local governments, NGOs, and community groups to gather ground-level data and insights.
\square Implement a schedule for regular reporting and analysis of collected data.
\square Cross-sectoral collaboration is fundamental for informative evaluations, involving
statistical institutes and leveraging EU tools like the EPD, as well as the ENPOR split
incentive calculator.

Examples of best practices can be modeled on EU-level initiatives like the ENPOR EPD, which provides robust data for measuring and monitoring energy poverty and the effectiveness of policies. Also, be on the lookout for updated monitoring frameworks published following the recast EED and EPBD.

SocialWatt, another ENPOR sister project, developed, adopted, tested and spread innovative schemes to alleviate energy poverty. The appropriate tools - SocialWatt Tools - developed within the framework of SocialWatt aim to help utilities and energy suppliers effectively identify energy poor households, as well as develop and monitor schemes that focus on increasing the energy efficiency of these houses.

3.5 Enhance Tenant Participation and Decision-Making

\square Increase tenant participation by involving them in decision-making for the ren	ovation
process through a consultative role, alongside owners or representatives of	rental
apartments/housing associations.	
☐ Use digital table to promote wider consibilization to the tonic and eve	بالمبيالي

Use **digital tools** to promote wider sensibilization to the topic, and eventually participation in the housing association decision-making process, making it more accessible, democratic and transparent at the same time. Such tools can include:

- Virtual meetings and seminars
- o Interactive websites
- o Mobile applications
- o Social media channels linked to NGOs, associations, etc. involved
- Online survey or feedback forms

□ Capacity-I	building programs are	a great opportun	ity for vulnerable	tenants to improve
their underst	tanding about and eng	gagement in ener	gy efficiency mea	sures, thus tenants
should be pr	esented with the oppo	ortunity to attend	such events via ac	ccessible formats at
times	which	suit	their	schedules.

Real world examples

Examples of best practices from the <u>Programme</u> to Promote the Improvement of Energy Efficiency of Housing, overseen by the Ministry for Transport, Mobility and the Urban Agenda in Madrid, include offering financial assistance for energy efficiency renovations in households. This program is particularly notable for its inclusive approach, providing increased aid to people with disabilities and young people in rural municipalities. By targeting these specific groups, the program ensures that the benefits of energy efficiency improvements are accessible to some of the most vulnerable segments of society, thereby addressing both energy efficiency and social equity, while offering a great opportunity for enhanced community building.

3.6 Strengthen Support for Building Associations	
 □ Provide targeted support for building associations, especially those lacking renoval capacity, to aid in the full renovation process. □ Start by assessing the renovation needs of an area or a property. □ Establish contact with the relevant stakeholders and work with their determine their actual capacity to implement renovations. □ Present tailored financial support programs suitable to tenants and landle □ Simplify (or offer support in) the application procedure. □ Provide a list of pre-vetted available and reliable local contractors and expected to carry out renovation works. □ Encourage the use of national renovation grants for comprehensive renovations are used specifically for the enhancement of thermal comfort energy efficiency of properties. 	m to ords. perts
Real would average	
Real world examples	

Examples of best practices include the support for comprehensive renovations using national grants, as seen in the policy frameworks of Estonia and Greece, where building associations play a crucial role in effectively managing renovation projects and funds, while also serving as a liaison between tenants, landlords, and contractors to ensure successful implementation and compliance with energy efficiency standards.

3.7 Financial Longevity and Market Considerations

\square Ensure national renovation grants are financed for a minimum number of years (10)
to be determined by local stakeholders and authorities which can provide long-term
certainty and support for citizens facing energy poverty.
\square Acknowledge market dynamics when introducing regulatory measures to avoid
distortions, involving all responsible public authorities in these discussions.

4. FINAL CONSIDERATIONS

It is important to note that the measures outlined in this checklist, including both training and renovation grants, are most effective when implemented in tandem rather than in isolation. The integration of comprehensive training programs with financial support mechanisms for renovations creates a more holistic approach to reducing energy poverty, by combining the empowerment of citizens through increased knowledge gained via trainings with the practical support of renovation grants. Implementing bodies can therefore achieve a more significant and sustainable impact in alleviating energy poverty in the PRS by applying both measures in parallel.
